

SLIDE 1 - TITLE

EchoBank
Banking you can hear. Banking you can trust.

Subtitle:
Voice-first accessible banking for blind customers, with built-in fraud protection.

Presenter note:
Lead with confidence. This is not an accessibility add-on. It is a new banking interaction model.

SLIDE 2 - THE PROBLEM

Title:
Blind customers are still banking through interfaces built for sight

Body:

- Mainstream banking apps assume visual verification
- Screen readers read what exists, but they do not redesign the flow
- Blind users still struggle to confirm amounts, scan transactions, and trust payment steps independently

Closer line:
Accessibility retrofits do not create confidence. They create workarounds.

SLIDE 3 - THE USER

Title:
Who we built this for

Body:
Our user is a blind customer who wants to bank independently, safely, and without relying on another person to read the screen or verify a payment.

Key needs:

- hear balance and account state clearly
- understand recent activity quickly
- send money safely
- avoid scams and pressure tactics
- hear bank messages without outside help

SLIDE 4 - THE SOLUTION

Title:
EchoBank is a voice-first banking experience

Body:
EchoBank is designed around hearing, speech, touch, and confidence. Instead of adapting a visual app after the fact, we design the banking journey so a blind customer can use it directly.

What it does:

- spoken balance and account summary
- audio-guided activity review

- safer payment flow
- accessible message reading
- preference controls for speech, haptics, and sound cues

SLIDE 5 - WHAT MAKES IT DIFFERENT

Title:

This is not just accessible. It is safer.

Body:

Most accessibility tools help a blind customer use an existing system. EchoBank changes the system itself.

Core differentiators:

- audio-first design
- earcons for transaction categories
- scam-risk checks before payment
- confirmation designed for blind trust, not blind clicking

SLIDE 6 - PRODUCT DEMO FLOW

Title:

One customer journey

Body:

1. Open app and hear a spoken summary
2. Review recent activity by sound and speech
3. Start a payment
4. Detect scam signals before the transfer
5. Confirm safely

Presenter note:

Keep the live demo narrow. Do not try to show every feature.

SLIDE 7 - SCAM SHIELD

Title:

Fraud prevention is part of accessibility

Body:

EchoBank checks for:

- new payees
- unusual amounts
- out-of-hours behavior
- urgency and secrecy language
- impersonation-style requests

Closer line:

For a blind customer, safety is not a separate feature. It is core UX.

SLIDE 8 - WOW FACTOR

Title:

Safe Circle Verify

Body:

If a payment looks risky, EchoBank can say:

"This does not look safe. Would you like to ask someone you trust?"

What happens next:

- the app creates a short spoken verification summary
- it explains the amount, payee, and risk signals

- the user can escalate to a trusted contact before money moves

Why it matters:

- supports independence
- reduces pressure-based fraud
- creates a memorable product edge

SLIDE 9 - WHY THIS WINS

Title:

Why judges and banks should care

Body:

- solves a real accessibility failure
- reduces fraud risk
- has emotional and commercial value
- demonstrates product thinking, not just engineering
- can extend beyond blind users to anyone who needs safer hands-free banking

SLIDE 10 - BUSINESS VALUE

Title:

This is a product investment, not a compliance cost

Body:

- expands access for underserved customers
- lowers APP fraud exposure
- improves trust and brand differentiation
- creates reusable accessibility and safety patterns

Closer line:

Built for one group. Valuable for many.

SLIDE 11 - WHY NOW

Title:

Why this matters now

Body:

- digital banking is still visually biased
- fraud pressure is rising
- reimbursement pressure is increasing
- accessibility expectations are growing

EchoBank sits at the intersection of accessibility, trust, and safer digital banking.

SLIDE 12 - WHAT WE HAVE BUILT

Title:

Current MVP

Body:

- account home with spoken summary
- payment flow with scam checking
- activity review with audio cues
- letters reading
- settings for accessibility preferences
- backend structure with seeded demo data

Presenter note:

Be honest. Say this is an MVP with strong foundations and a focused next step.

SLIDE 13 - WHAT WE WOULD BUILD NEXT

Title:

Next step to production-strength value

Body:

- complete assistant journey
- add real letter summaries
- finish spoken confirmation path
- ship Safe Circle Verify
- harden fraud and accessibility flows

SLIDE 14 - CLOSE

Title:

Banking should not depend on sight

Body:

EchoBank gives blind customers something most banking apps still do not: independence with confidence.

Closing line:

We are not making banking easier to hear.

We are making it safer to trust.
